March 2023

Congratulations 2023 JOR Spine Early Career Award Winners!

Rebecca Wachs, PhD
University of Nebraska

“Axial hypersensitivity is associated with aberrant nerve sprouting in a novel model of disc degeneration in female Sprague Dawley rats”

Ben Walter, PhD
The Ohio State University

“Pericellular Heparan Sulfate Proteoglycans: Role in Regulating the Biosynthetic Response of Nucleus Pulposus Cells to Osmotic Loading”
Did you fill out the Spine Symposium Survey?

We hope you enjoyed the 2023 ORS Spine Section Symposium! We are always looking for ways to improve our meetings so that we can reach more people interested in the ORS! We have a short survey, and we’d love to hear from you! If you have any questions about the survey, please don't hesitate to reach out.

Thank you for attending the 2023 ORS annual meeting!

Research Section Member Spotlight

This issue features Kyle Kuchynsky, B.S. (he/him) - Ph.D. Student, Department of Biomedical Engineering, Ohio State University

**Undergraduate Degree:** B.S., Biomedical Engineering (Ohio State University)

**Who do you consider your mentors?**

I consider a lot of people in my lab as my mentors, but especially my advisor Dr. Devina Purmessur, Dr. Ben Walter, and Nina Tang.

**What is your specific area of interest in research?**

I'm interested in the role that cartilage endplate cells may play in mediating spine health and disease.

**What are you currently working on?**

I'm finishing optimizations for an upcoming cell culture study, mechanical testing of motion segments, and analyzing transcriptomics data.

**What has been the biggest challenge for you lately in your research?**

Time and focus. I'm working on multiple projects and there can be so many different directions that each of them can go in...it can be overwhelming and tough to prioritize which project to work on in the moment, plus making sure I don't fall into rabbit holes while reading papers or as we collect new data.

**What are projects are you looking forward to?**
I'm very close to getting a long-awaited cell culture experiment off the ground, so I'm excited for that and seeing how the results turn out.

**What do you like to do outside of your work?**

My hobbies are running and playing Nintendo games like Smash Bros and Pikmin. I ran competitively with Ohio State's Running Club and ran in marathons until the start of the ongoing Covid-19 pandemic. I haven't competed since then, but I still run routinely.

**What is the last book you read?**

It's been a few years, but I think the last book I read was “Eat and Run” by Scott Jurek. It's an ultramarathoner's account of how he transitioned to a more plant-based diet and how he felt it impacted his running and well-being. It actually motivated me to be vegetarian for a year; I am eating meat again, but that experience forced me to learn how to cook, and I cook almost exclusively vegetarian dishes at home now.

**What is the most unusual/unexpected item sitting on your desk right now?**

I don't have anything super unusual right now, so I put a can of corn there just for this question. I'm going to put it back now.

---

**Are you looking to enrich your orthopaedic education?**

LearnORS has you covered! Click on each course title for more information about the offerings on our online platform that offers a complete learning experience in an exciting format to meet learners' educational needs.

**Scientific Courses:**
- Art of Grant Writing
- Orthopaedic Basic Science Course
- Principles of Clinical Research
Career Development Courses:
Enhanced Writing and Publication Skills

Have an idea for a LearnORS Virtual Scientific Session or Course?

Those who have an idea for a future Virtual Scientific Session should speak with their section or committee leaders about eligibility and the application process.

Check out the current LearnORS Virtual Session Schedule

Did you know that you could submit ideas for educational content for potential use in LearnORS? We regularly accept suggestions for content which might be implemented into training to be made available throughout the year on the ORS website.

Submit your idea for content

Herniation of the nucleus pulposus (NP) through structural defects in either the annulus fibrosus (AF) or cartilage endplate (EP) is associated with painful disc degeneration. These disruptions depressurize the nucleus pulposus, which alters disc biomechanics and exposes the extradiscal space to the inner disc material. Such interactions have been proposed as a cause of pain, such as in Modic changes, though the mechanisms of pain generation are still unclear. Spinal cord sensitization and neuroinflammation are mediators of neuropathic pain in nerve injury models, and thus was seen as a possible source of
discogenic pain. As a result, the authors hypothesized that endplate injury would induce pain via sensitization and neuroinflammation of the spinal cord.

A recently validated in vivo rat endplate injury model was used to study the effects of trans-endplate injury on 1) the development of neuroinflammation and sensitization of the spinal cord, 2) the invasion of CD68+ macrophages into the disc and adjacent structures, and 3) whether these spinal cord and immune cell changes correlate with pain behaviors and disc degeneration. Male skeletally mature Sprague-Dawley rats received either trans-endplate injury, via puncture of the cranial endplate through the superior vertebrae, or sham surgeries. After 8 weeks post-surgery, the rats were euthanized and the lumbar spine and spinal cord were collected. Von Frey and grip force assays were conducted to assess pain pre-surgery and prior to euthanasia. Lumbar spines were imaged using μCT, then stained to assess degeneration and identification of CD68+ macrophages. Spinal cords were stained for SubP, Iba1, and GFAP to assess activation of nerves, microglia, and astrocytes, respectively. Pain, disc measures, and spinal cord histology were correlated using Spearman’s correlation coefficients.

Rats with injured endplates displayed increased pain behaviors and signs of increased disc degeneration relative to sham rats. Similarly, SubP, Iba1, and GFAP expression in the spinal cord were upregulated in spinal cords from injured rats, suggesting increased spinal cord sensitization and neuroinflammation. Macrophage infiltration into the injured endplates and vertebrae was also reported. Pain measures were significantly correlated with spinal cord changes and disc degeneration. Further, spinal cord changes were significantly correlated with disc degeneration. Taken together, these results highlight that endplate injury induces disc degeneration and could contribute to discogenic pain via changes within the spinal cord. These results may also inform the development of new analgesic therapies that target chronic changes within the spinal cord in response to endplate injury.

Looking to catch up on Annual Meeting content? You still have access to view all recordings until April 14th, 2023. Enjoy sessions like Spotlight Speakers, the Annual Meeting program, and more.
Spine Section Symposium, and more! Just log on to the virtual platform with the unique credentials you received for the virtual platform. If you do not remember your password, email orsprograms@ors.org.

If you were unable to attend the meeting in person, recordings of Podium, Plenary and other Sessions, Workshops and Symposia are available to you on the virtual platform at the following rates:
Members: $229
Emeritus: $55
